

Sentrix: AI-Powered Network Intelligence

Filtering the noise. Resolving the critical.

GRM PROJECT

GUIDED BY SHAILENDRA MOYAL & ROHIT SHARMA

Modern networks are drowning in chaotic, uncontextualized noise.

Alert Fatigue

Thousands of daily raw alerts bury actual critical failures.

Manual Triage

Teams spend hours hunting for root causes instead of fixing them.

Fragmented Context

System logs, vulnerability databases, and hardware statuses live in separate silos.

Moving from reactive firefighting to proactive, AI-driven clarity.

	Traditional Monitoring	Sentrix Platform 
Detection	Raw Log Aggregation	Context-Aware Alerting
Analysis	Manual Root-Cause Hunting	AI-Powered Incident Summaries
Vulnerabilities	Separate Security Audits	Real-Time NVD/CVE Data Enrichment
Action	Disconnected Ticketing	Automated Workflow Routing

A five-layer architecture designed to filter, enrich, and resolve.

Command Center: Surfacing Intelligence

Dashboard:
This aggregates
processed insights
from AI.

Trends & Insights:
This uses
AI-driven
pattern detection.

Tickets:
Converted from
analyzed events.

SERVICE STATUS
SYSTEM OPERATIONAL

Service Status:
Real-time monitoring
+ event ingestion.

Incident History:
AI-generated root cause
+ resolution tracking.

Watson AI takes an open-book exam for every critical alert.

Step 1: Retrieve - System spots an event and instantly looks up relevant vulnerabilities.

Step 2: Generate - Watson AI reads the event alongside the threat library to produce a highly accurate, hallucination-free diagnosis.

Transforming raw network events into structured resolution workflows.

Sentrix AI Enrichment

[Priority: Critical]

Immediate attention
required due to
severe impact.

[Cause: Switch OSPF Failure]

Identified root
cause through
network analysis.

[Action: Reboot Interface]

Automated resolution
path initiated for
recovery.

Global visibility reveals the real-time health of the entire infrastructure.

The AI isolates critical threats and generates actionable workflow tickets.

The image displays two side-by-side screenshots of the Splunk interface, illustrating the workflow from raw log alerts to actionable tickets. A large blue arrow points from the left screenshot to the right one.

Left Screenshot: Priority Alerts

The left screenshot shows the 'Priority Alerts' section. It features a summary of alerts by priority: 3 Critical (Priority 1), 2 Major (Priority 2), 0 Minor (Priority 3), and 1 Info (Priority 5). Below this, a table lists individual alerts with columns for Severity, Timestamp, Device, AI Summary, Status, Confidence, and Actions.

Severity	Timestamp	Device	AI Summary	Status	Confidence	Actions
Info	4 days ago 2020-08-23 15:40:14Z	RTN-CORE-01 10.0.0.1	OSPF Neighbor Adjacency Restored OSPF neighbor adjacency has been restored. Scheduling cleanup to certain neighbor adjacency after a previous failure.	Resolved	90%	
Info	4 days ago 2020-08-23 15:40:14Z	UDR-023-A 10.0.0.1	OSPF Hello Sent Threshold OSPF hello timeout has been restored. Scheduling cleanup to certain neighbor adjacency after a previous failure.	Resolved	90%	

Right Screenshot: Tickets

The right screenshot shows the 'Tickets' section. It features a summary of tickets: 4 Open, 6 Assigned to Me, 6 SLA Breached, and 3h 54m APO Requisition. Below this, a table lists individual tickets with columns for ID, Subject, and Priority.

ID	Subject	Priority
T01-001	Investigate Core Switch Interface Down	Critical
T01-001	Firewall CPU Usage Remediation	High
T01-001	800 Peering Link Investigation	High
T01-001	800 Peering Link Investigation	High

The right screenshot also shows a detailed view of a ticket (TKT-001) titled 'Investigate Core Switch Interface Down'. It includes an overview, activity, and related alerts section.

Watson AI translates raw log codes into plain-English summaries.

High-priority alerts automatically generate SLA-tracked tickets.

Historical analytics ensure the system learns from every resolved incident.

Continuous tracking of Mean Time To Resolve prevents future downtime.

A complete operational ecosystem beyond basic monitoring.

Visual Topology

Mapping physical device interconnections.

On-Call Routing

Automating schedule management and human escalation.

Automated Runbooks

Standardizing fixes for known issues.

Overcoming scale and integration hurdles as a unified team.

The Hurdles

Latency in AI response during heavy log floods.

Context limitations in LLM processing for complex network topologies.

The Solutions

Engineered asynchronous API pipelines to decouple UI from heavy AI processing.

Refined the RAG architecture to strictly query only relevant CVE data, reducing token overhead.

Sentrix fundamentally transforms network operations and security.

Eliminated Alert Fatigue.

AI filters out raw noise, ensuring engineers only see validated, high-confidence network threats.

Reduced MTTR.

By serving root causes directly alongside the alert, investigation time drops from hours to minutes.

Proactive Security.

Real-time NVD enrichment guarantees zero-day vulnerabilities are flagged instantly against active hardware.

Expanding intelligence: The next phase of Sentry.

Predictive Diagnostics

Forecasting hardware failures before they trigger an alert based on historical telemetry.

Third-Party Integrations

Expanding webhook support for native Slack, PagerDuty, and ServiceNow synchronization.

Automated Remediation

Allowing the AI to securely execute low-risk runbook scripts autonomously.

Future Scope: The Path to Full Autonomy

1. Predictive Incident Detection
(time-series forecasting)

2. Autonomous Remediation

3. Expanded Threat Intelligence

4. Advanced AI Models

5. Personalised & Adaptive Dashboards

6. Real-time Streaming & Scalability

7. Deeper Integration with Enterprise Tools
(JIRA, Slack, etc.)

Thank You
